Professor ZAROUR Karim

Context:

This project is part of the digital transformation in the freelancing market. It aims to fix the gaps between **Startup's** and **freelancers**. The platform is not just a place to find jobs; it is a **'Complete Work Ecosystem**' that supports the user from start to finish. It offers smart recommendations based on trust, provides legal protection through digital contracts, and ensures secure payments based on actual work.

The main innovation is the use of **'Dynamic Monitoring**.' The system **tracks** and **analyzes** the freelancer's **performance** and professional **behavior in real-time**. This data creates an **'Intelligent Professional Identity**' for the freelancer. This approach does more than just ensure high-quality work; it helps freelancers grow through automated development plans. At the same time, it gives a **Startups** clear tool to **lower risks** and choose the best **freelancers** based on real, proven results.

Motivations:

1. **Moving Beyond Traditional Selection:** Selecting the right **freelancers** based on "real behavior and performance" rather than just the claims written in a CV.
2. **Legalizing Freelance Work:** Turning informal agreements into documented legal commitments (digital contracts) to ensure seriousness and protect the rights of both parties.
3. **Turning Static Data into a "Living Identity":** Making the freelancer's profile reflect their true "professional reputation" (like discipline and responsiveness) instead of relying on misleading star ratings.
4. **Linking Payment to Actual Progress:** Ending payment disputes with a system that connects funds to completed work milestones, providing financial security for both sides.
5. **Closing the Monitoring Gap:** Providing a tool that prevents communication breakdowns by tracking the project's progress in real-time to ensure everything stays on track.

Problematic situation:

The freelance market faces a double dilemma: while **freelancers** look for fair opportunities, **Startups** struggle to find real **freelancers** among exaggerated CVs. Traditional methods are no longer enough, leading to our core question: **How can we design an intelligent platform that overcomes the limitations of current solutions to provide seamless, reliable, and AI-optimized freelance management?**

This main question leads to the following sub-questions:"

- How can we move from hiring based on 'CV claims' to hiring based on **'real behavior and performance'** tracked by the system?
- How can we turn informal agreements into **'documented legal contracts'** that protect both parties from the very start?

- How can we replace misleading 'star ratings' with a **'Living Professional Identity'** that reflects true discipline and responsiveness?
- How can we end payment disputes by linking **'funds' to 'actual progress'** and verified quality?
- How can we ensure a smooth workflow and prevent communication breakdowns through a **'dynamic monitoring system'** that tracks project development in real-time?
- How can we **track the freelancer's long-term professional evolution** and turn their performance data into a roadmap for self-growth?
- How can we provide companies with a precise tool for **risk assessment**, allowing them to make hiring decisions based on authentic, documented merit?

Objectives:

The project aims to integrate **Artificial Intelligence (AI)** as the core driver of the platform through the following:

- **Using AI for Selecting the Best freelancer's:** AI helps companies filter through thousands of CVs to find the person whose "actual performance" matches the task requirements, reducing the risk of bad hiring.
- **Using AI for Professional Behavior Analysis:** Instead of manual reviews, AI analyzes work data (like response speed and deadline commitment) to build a real and reliable image of the freelancer's "professionalism."
- **Using AI for Monitoring and Follow-up:** AI is used to analyze project progress moment by moment, ensuring work meets the required standards without needing constant manual supervision from the company.
- **Using AI for Generating Development Plans:** AI automatically diagnoses weaknesses in a freelancer's performance and suggests specific "improvement axes" (Axes d'amélioration) and a personalized plan to boost their skills.
- **Using AI for Secure Transactions:** AI monitors if the work delivered matches what was agreed upon in the "Digital Contracts," then signals the system to release payments or alerts the parties to any issues.
